"Great product for data test automation initiative"

Overall: We want to make sure data changes are implemented correctly prior to releasing code into production. This tool allows us to catch a lot of issues prior to prod release. It is a must have for any data shop that deals with large data transformations.

Pros: My department validates data across different platforms supporting Data Warehouse, ODS and Data Lakes. We release changes weekly into production. This tool allows me to work with large datasets across many different RDBMS (Oracle, SqlServer, etc), plus Hadoop/Hive. The look and feel of the interface is easy, testers can setup validation rules very quickly.

Cons: Code repository for the rules/scripts. It would be nice to know which tester modified the rules last, and ability to version control them.

Alternatives Considered: ETL Validator

Reasons for Choosing iCEDQ: Integration with ALM, simplicity of the user interface
